INTRODUCTION

Traffic Impact Study is a specialized study of the impact that a given type and size of new land use has on the nearby transportation system.

The main purposes for preparing Traffic Impact Studies are:

- 1. To ascertain the operational conditions on the adjacent roadway network when a proposed development is accommodated within the existing transportation infrastructure along with other proposed developments.
- 2. To identify transportation improvements required to maintain the existing operational conditions.
- 3. To determine whether access to the proposed development will hamper traffic operations and safety near the site.
- 4. To provide decision makers with a basis for assessing the transportation implications of approving proposed zoning changes and development applications.
- 5. To provide a basis for estimating the cost of proposed mitigating measures. Consequently, a traffic analysis can be used to determine the "fair share" of the improvement cost to be paid by the developer.

PURPOSE OF THIS GUIDE

This guide is intended to establish a standard methodology for conducting Traffic Impact Studies. This will result in a consistency with study requests, preparation and review. Such a standardized procedure will be beneficial to everyone involved in the development process. First and foremost, the guide will lead the applicant through a step-by-step procedure and enable him or her to present the study findings and recommendations in a systematic manner consistent with the reviewer's expectations. Second, it will enable reviewers to evaluate the study in a systematic manner. Finally, it will promote understanding and awareness of transportation-related issues among those involved in the development process.

The guide is not intended to make things more complicated and time-consuming; on the contrary, as the assumptions and procedures become accepted practice, the time involved in the process will decrease for both parties.

APPLICANT AND REVIEWER QUALIFICATIONS

All Traffic Impact Studies are to be prepared by a Transportation Professional with training and experience in traffic engineering and transportation planning. It must be prepared by or under the supervision of a Professional Engineer registered in the State of Florida with experience in traffic engineering operations. The study should contain a statement of certification as follows:

"I certify that this TRAFFIC IMPACT STUDY has been prepared by me or under my immediate supervision and that I have experience and training in the field of traffic and transportation engineering. (signed)
John O. Smith, P.E.
Florida Registration #12345
Consulting Firm, Inc."

All Traffic Impact Studies shall be signed and sealed by a professional engineer as required by Chapter 471, F.S.

REVIEWER QUALIFICATIONS

The professional staff of Collier County Transportation Operations Development Review Department shall review all Traffic Impact Studies. For brevity, Collier County Transportation Operations Development Review Department will hereinafter be referred to as CCTDR.

REFERANCES

The Standard References to be used in conjunction with this guide are as follows:

- 1- Florida Department of Transportation, Manual on Uniform Traffic Studies.
- 2- Florida Department of Transportation, Site Impact Handbook.
- 3- Institute of Transportation Engineers, Traffic Engineering Handbook.
- 4- Institute of Transportation Engineers, Highway Capacity Manual.
- 5- Institute of Transportation Engineers, Trip Generation, Vol. 1, 2,3.

ETHICS AND OBJECTIVITY

Although applicants and reviewers might have different objectives and perspectives, they should adhere to established engineering ethics and conduct all analyses and reviews objectively and professionally.

STUDY PROCEDURE

The Traffic Impact Study, hereinafter is to be referred to as TIS, should be considered in conjunction with an application for approval of any of the following:

- zoning changes
- subdivision/platting (where no zone change is associated)
- site development plans (where no zone change is associated)
- comprehensive plan amendments requested by the developer

The proposed process of a Traffic Impact Study will consist of up to four steps, depending on the type of development under consideration. The different stages of a Traffic Impact Study procedure are discussed below.

- Step 1. A Preliminary Notification will be required of all developments meeting certain "Preliminary Warrants." This is presented in Chapter 4 of this guide. If the development's predictor variables exceed the preliminary threshold values, the developer must provide CCTDR with the information that comprises a "Preliminary Notification" (see Chapter 4) and request that an "Initial Meeting" with CCTDR be scheduled (see item 2 below). If the development under consideration does not exceed the preliminary warrants, no further action is required and the TIS procedure stops here.
- Step 2. At a mutually convenient time, representatives of the developer and CCTDR will hold the initial meeting. Based on additional information gathered since the preliminary notification, the two parties decide if a more detailed Traffic Impact Study is necessary. (See Chapters 5 and 6 for guidance.) From the findings of the preliminary study, it will be determined if warrants for a complete TIS are met (Chapter 6). If the warrants are met, then a detailed Traffic Impact Study (discussed in Chapters 8 through 15) will be required for the development. If the warrants are not satisfied, go to step 3 (below); otherwise go to step 4.
- Step 3. This step involves determining whether the warrants of a traffic operations analysis are met. If the warrants are met, then a traffic operations analysis must be conducted (Chapter 7). If the warrants for a traffic operations analysis are not met, the study procedure stops here. Otherwise, go to step 4 (below).
- Step 4. This step involves the staff review (Chapter 16) of the traffic operations analysis or the Traffic Impact Study. If the analysis or study is satisfactory, the process stops here. Otherwise, the revisions suggested must be incorporated and sent back for further review. This is the final step in the study process.

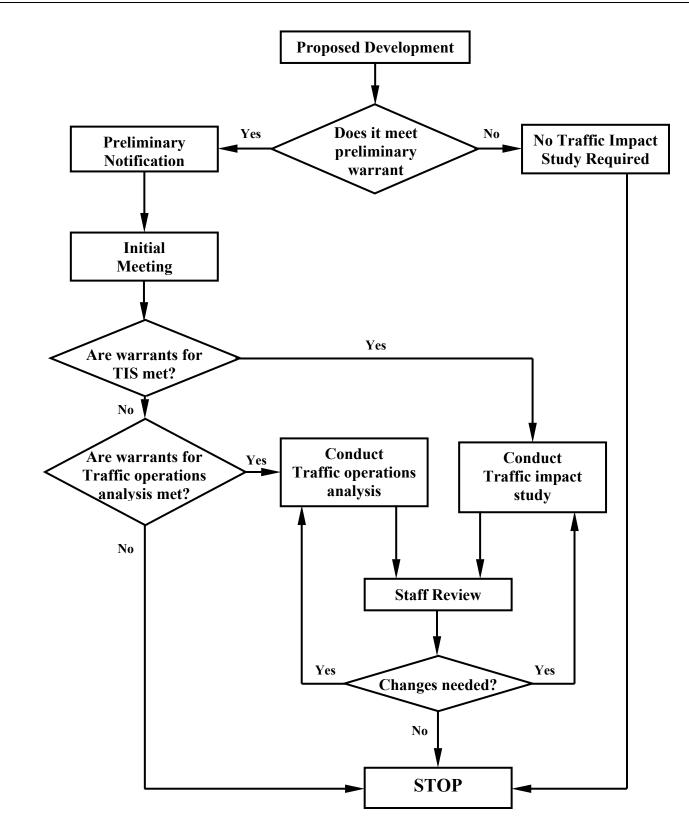

Figure 3.1. Flowchart Showing the Traffic Impact Study Procedure

PRELIMINARY NOTIFICATION

A Preliminary Notification to CCTDR will be required for all developments that meet the preliminary threshold values for Traffic Impact Studies. The preliminary notification must include:

- The type of development.
- A complete site plan, with the site's access points and the nearest signalized intersection in each direction.¹
- A market study (Trip Production/Attraction if applicable).²
- Trip generation values and the method(s) used to compute them.

The preliminary notification need not be a detailed analysis of the present and future conditions. No elaborate data collection effort or computer modeling is necessary for the notification. It is intended to provide an approximate description of existing and anticipated traffic conditions and is intended to provide a foundation on which to base discussion during the initial meeting.

PRELIMINARY WARRANT

A Preliminary Notification will be required of all developments that meet the "preliminary threshold values" or "warrants." The preliminary warrants are as follows:

| Land Use Type | ITE Code | Threshold Values |
|---------------|-------------------------|---------------------------|
| Residential | 210, 220, 222, 240, 252 | 99, 150, 280, 180, 600 DU |
| Retail | 814, 820 | 25,000, 5000 SF |
| Office | 710, 720, 770 | 19,000, 30,000, 24,000 SF |
| Industrial | 130,150 | 51,000, 150,000 SF |
| Educational | 520,522,530 | 400, 650, 600 Students |
| Lodging | 310 | 153 Rooms |
| Medical | 610 | 59,000 Square Feet |

Special generators with high trip generation rates, such as Banks (both drive-in and walk-in), Fast Food Restaurants, and Service Stations with Convenience Stores, will require a Preliminary Notification regardless of size.

For Planned Unit Developments (PUD) and for those development types discussed in the previous paragraph, the estimated trip generation rates must be determined using the latest edition of the ITE Trip Generation report. For developments that generate considerable truck traffic (i.e. Excavation Quarry, Land Fills), the truck trips should be converted to equivalent passenger vehicle trips.

¹ For Comprehensive Plan Amendment Studies, a conceptual site plan with boundaries and approximate location of access points will be sufficient.

² A market study applies to developments that have already performed trade area analysis. Examples include tourist destinations and entertainment centers.

INITIAL MEETING

(Methodology Development)

If the values for a proposed development exceed the preliminary warrants, an initial meeting between the developer's representative and CCTDR personnel will be scheduled. Depending on the development and the type of information to be discussed at the meeting, the following CCTDR personnel may need to attend the initial meeting:

- 1. Director of Transportation Development Review.
- 2. Transportation Review Engineer.
- 3. Concurrency Management Staff.
- 4. Development Engineer.

For brevity, the developer's representative will hereinafter be referred to as the Traffic Impact Study "preparer" and the CCTDR staff responsible for reviewing the study will be referred to as the Traffic Impact Study "reviewer."

The discussions in the initial meeting between the preparer and the reviewer will be based on the information contained in the Preliminary Notification. The initial meeting will serve the following purposes:

- 1. To determine whether a detailed Traffic Impact Study or traffic operations analysis is required for the proposed development.
- 2. If further studies are required, the meeting will help the study preparer understand the reviewer's expectations.
- 3. To discuss critical issues such as (but not limited to) the extent of the study, the study area, the horizon years, time periods to be analyzed, data sources and availability.
- 4. To ensure that all relevant issues are adequately addressed in the Traffic Impact Study, and that no extraneous elements are included in the study.

If a Traffic Impact Study is warranted (see Chapter 6), some of the issues that will need to be addressed in the initial meeting are discussed below.

STUDY AREA

Any Traffic Impact Study must include at least all site access points and major intersections adjacent to the site. The first signalized intersection on each street serving the site must also be analyzed, if it is within 1/2 mile of the site. Beyond this area, the proposed development's peak hour trip generation will determine the area of study extent (See Distribution, Page 15).

HORIZON YEARS

The horizon year of the TIS refers to the anticipated completion date of the proposed development assuming full build-out occupancy.

TIME PERIODS TO BE ANALYZED

The critical time period for any development will be directly associated with the peaking characteristics of both the <u>development</u> and the <u>adjacent roadway system</u>. Special consideration will be given to developments like shopping centers, which might peak after the adjacent street peak or on a Saturday. The following time periods should be considered during the initial meeting:

- AM and PM street peak (weekday)
- AM and PM site peak (weekday)
- Site peak (weekend)

DISCUSSION CHECKLIST

A discussion checklist has been provided in Appendix A to aid both parties in recording information and comments. However, the discussions should not be restricted to the issues addressed in the checklist. Larger developments in densely developed areas will need more indepth discussion, while smaller sites may not need discussion on many of the issues in the checklist.

MEMORANDUM OF UNDERSTANDING

Immediately after the initial meeting, the study preparer will submit a memorandum of understanding confirming the following:

- Issues to be addressed in the study.
- Study procedure
- Assumptions
- Data sources
- Report content
- Other pertinent issues discussed in the initial meeting

STAFF CONCURRENCE

The reviewer will evaluate the contents of the memorandum. If all elements are agreed upon, staff concurrence will be communicated in writing to the study preparer within five (5) business days of receipt of the Memorandum of Understanding. If staff is not in concurrence with all elements of the MOU, this will be communicated in writing to the study preparer within five (5) business days.

WARRANTS FOR A COMPLETE TIS

A formal Traffic Impact Study will be required for any development that meets any one of the warrants described below:

Warrant 1. Land Use Intensity

This warrant is satisfied when a development will generate traffic volumes in excess of 1,000 ADT (average daily trips) or 100 vehicles per hour / peak season, whichever is more restrictive. Collier County Land Development Code (Section, 3.2.8.4.16.4).

Warrant 2. Level-of-Service Warrant

This warrant is satisfied if the traffic generated by the proposed development causes the level-of-service (LOS) of the adjacent streets/intersections to drop to a LOS "D" or lower, or where nearby intersections presently operate at level-of-service "E" or worse. LOS determination should be in accordance with the procedures described in the Highway Capacity Manual, using data contained in Collier County Annual Update and Inventory Report (AUIR) or approved by the reviewer.

Warrant 3. Roadway Modifications

This warrant is satisfied when the proposed development is expected to <u>significantly</u> impact a roadway segment identified for improvement in the Transportation 5 Year Work Program. This warrant is also satisfied when the proposed development includes modifications to the roadway system. Modifications include addition of lanes to accommodate site-generated traffic, addition of exclusive turning lanes, acceleration/deceleration lanes, median openings, installation of traffic signals and other traffic control devices, etc.

11

³ Significant Impact is defined as the traffic impact on roadway segments directly accessed by the project where project traffic is equal to or greater than three percent of the adopted LOS standard service volume.

TRAFFIC OPERATIONS ANALYSIS

A Traffic Operations Analysis is conducted whenever a proposed development may compromise existing design standards and therefore may cause safety and operational problems in the immediate vicinity of the site. A traffic operations analysis might include:

- 1. Study of proposed driveway locations, resulting sight distances, queuing provisions, etc.⁴
- 2. Safety analysis.⁴
- 3. Traffic signal warrants and progression analysis.⁴
- 4. Delay analysis.⁴
- 5. Gap studies.⁴

WARRANTS FOR TRAFFIC OPERATIONS ANALYSIS

A Traffic Operations Analysis will be required if one or more of the following conditions is satisfied:

- 1. A development generates sufficient turning movements into or out of the development to require an auxiliary lane, such as an acceleration/deceleration lane, roadway transition, or separate turn lane. (See Ordinance 2003-37 as it may be amended).
- 2. Requests for new or modified driveways within 660 feet of intersections or interchanges.
- 3. Requests or potential need for a new (or modified) traffic signal to control driveways or streets serving a proposed or existing development(s).
- 4. Existing sight distance limitation, or high crash location near the site.
- 5. Requests for new or revised median openings.

_

⁴ See FDOT Manual on Uniform Traffic Studies, ITE Traffic Engineering Handbook, HCM and MUTCD.

NON-SITE TRAFFIC ESTIMATE

For estimating the traffic impacts of a proposed development, it is essential to analyze the traffic conditions on the horizon year roadway network for two cases:

- (a) With the proposed development.
- (b) Without the proposed development.

The incremental impacts are attributed to the site-generated traffic. For this analysis, a "base condition" must be established. The base condition corresponds to the traffic that would exist in the study area in the horizon year without the proposed development. This traffic is commonly referred to as non-site traffic. Non-site traffic may be of two kinds

- Through traffic, which has neither an origin nor a destination in the study area
- Traffic that has either an origin or a destination or both in the study area. This traffic is generated by other developments in the study area

Non-site traffic will be estimated by one of five methods:

- 1. Manual Method.
- 2. Build-Up Method.
- 3. Growth Factor Using Related Demographic Characteristics.
- 4. Regression Analysis Techniques.
- 5. Collier County MPO Model.

For detailed explanation of the above methods, see FDOT Site Impact Handbook, Unit III.

TRIP GENERATION

Trip generation involves estimating the number of trips that will be produced from or attracted to the proposed development. This is one of the most important steps in Traffic Impact Studies.

ACCEPTABLE DATA SOURCES

Several sources and methods of obtaining trip generation data are available and may be used:

- 1. ITE TRIP GENERATION, Current Edition -- This report allows estimates of trip generation based on three different options; in order of preference:
 - 1. Regression Equations.
 - 2. Graphic Plot.
 - 3. Average Trip Rate for specific land use.

The estimates obtained from this source must be used with good judgment as they are based on national data and would fail to take into account any special features that the local subject site might have. An existing trip generation credit is given to the property's prior use if in existence within five years of the TIS. Trip generation information should be presented in the TIS as a Table in the format shown in Appendix B.

- 2. OTHER NATIONAL DATABASES -- Two other possible sources for estimating trip generation are NCHRP 187 manual and The Development and Application of Trip Generation Rates. The former contains trip generation rates for a variety of land uses, mostly suburban. The latter is essentially an updated version of the former, with some statistical measures of variances of the data
- 3. PRIOR STUDIES -- Data from prior studies made on a similar land use under similar conditions may also be used with permission from the reviewer.
- 4. DATA COLLECTION -- If existing data are not available or are not a good representation of specialized characteristics that the site under consideration might have, a data collection effort must be conducted at sites that exhibit similar characteristics as the study site. This option must be reviewed and approved by the reviewer prior to any field data collection effort.

MIXED-USE DEVELOPMENTS

In case of mixed-use developments (PUD's), certain deductions may be made to the trip generation rate derived by adding the trip generation rates of the individual land uses to accommodate the possibility of internal trips. Mixed-use developments are discussed in Chapter 13 of this guide.

PASS-BY TRIPS

The methodology for handling pass-by trips is discussed in detail in Chapter 12 of this guide.

TRIP DISTRIBUTION

After the trip generation estimates have been made, it is necessary to distribute these trips to make an assessment of the impacts of the proposed development. The outcome of the trip distribution method will be origin-destination data for generated trips. Trip distribution using the gravity model is encouraged either manually or by computer. In either case, the preparer must document the procedure properly. Collier County Metropolitan Planning Organizations (MPO) has data by zones that can be used. Other distribution procedures, such as intervening or attenuating opportunities are acceptable, but the specific methodology should be discussed with and agreed to by the CCTDR staff prior to use in the TIS. Trip distribution by hand may be used for developments where the development will produce less than 500 peak hour trips. The procedure, whether manual or computerized, produces direction-of-approach information and reduction in site traffic at an increased distance from the site. Hence, the gravity model approach is useful when it is necessary to evaluate the traffic impacts of developments on intersections at a certain distance from the site. This method, however, should be used for large projects and is required for analysis of Developments of Regional Impact (DRI). For small distances from the site, the estimates are too rough.

The proposed project highest peak hour trip generation will determine the area the trip distribution is to be carried out, as follows:

- Trips distributed on links directly accessed by the project where the project traffic is equal to or exceeds 3% of the adopted peak hour LOS standard service volume.
- Trips one link adjacent to the links directly accessed by the project where the project traffic is equal to or greater than 3%.
- Trip on all subsequent connecting links where the project traffic is equal to or greater than 5% of the adopted peak hour service volume.

The analysis must be carried out one link beyond the point where the project traffic drops below 5% of the peak hour adopted LOS service standard to determine whether project traffic becomes significant again due to a reduction in service volume on any subsequent links to a point where project traffic drops below acceptable service volume. A segment is identified in the AUIR, but also relates to where a roadway break is made by intersecting arterials or collectors (by functionally classified facilities).

A table of the Roadway Segments, Corresponding Segment Numbers, Current Traffic Volumes, 3%, 5% of Existing and Committed Road Service Volume and Available Capacities is attached in Appendix A1. It will change monthly as project trips are added, existing traffic counts are updated and service volumes are revised. If you wish to obtain an up-to-date electronic file of this list you may email your request to transplanning@colliergov.net.

TRAFFIC ASSIGNMENT

Traffic assignment involves assigning the distributed trips to specific paths in the road network. Hence, the product of traffic assignment will be the total project-generated traffic by direction and by turning movements on the horizon year roadway network in the study area. Assignment should be made after taking into account logical routing, available roadway capacities and projected and perceived minimum travel times. Multiple paths should be assigned between origins and destinations rather than assigning all of the traffic to the route with the shortest travel time. The assignment may be done manually or by computer.

Project traffic for both the peak and off-peak direction must be indicated. Project trips must be indicated on both a map of the study area and in a Table Format (See Appendix B).

Pass-by, Primary, and Diverted Linked Trips

Shopping centers and several other convenience-oriented land use types like banks, gas stations and fast food restaurants have trip characteristics different from other land use developments. A certain percentage of their trips are "captured" from the adjacent traffic stream. These trips already existed before the development. The type of trips generated by a site may be broken down into the following categories:

• Pass-By Trips:

Pass-By trips are made as intermediate stops from an origin to a primary trip destination without a route diversion. Pass-By trips are attracted from traffic passing the site on an adjacent street or roadway that offers direct access to the generator.

• Non-Pass-By Trips:

Non-Pass-By trips are simply all trips generated by a site that are not pass-by trips. This term is sometimes used when diverted linked trips are not tabulated separately from primary trips.

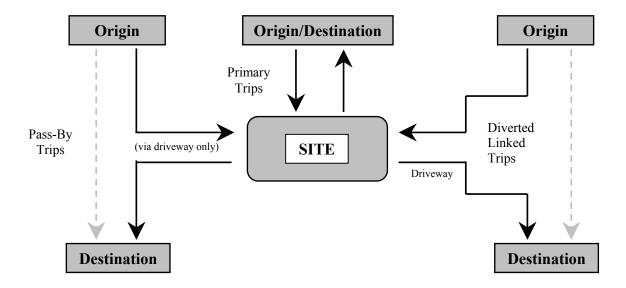

• Primary Trips:

Primary trips are trips made for the specific purpose of visiting the generator. The stop at the generator is the primary reason for the trip. The trip typically goes from origin to generator and then returns to the origin. For example, a home to shopping to home combination of trips is a primary trip set.

• Diverted Linked Trips:

Diverted linked trips are trips that are attracted from the traffic volume on roadways within the vicinity of the generator but that require a diversion from that roadway to another roadway to gain access to the site. These trips could travel on highways or freeways adjacent to a generator, but without access to the generator. Diverted linked trips add traffic to streets adjacent to a site, but may not add traffic to the area's major travel routes.

Figure 12.1 shows a schematic representing Pass-By, Primary and Diverted Linked Trips.

MIXED-USE DEVELOPMENTS/INTERNAL TRIPS

Mixed-use developments refer to activity centers that have a number of different land uses (PUD). In such cases it is often inappropriate to simply add up the trip generation rates of the individual land uses to determine the trip generation rate of the entire development. This is because some individuals will visit two or more destinations without leaving the site. Therefore, to estimate the trip generation rates of such developments, the number of internal trips has to be estimated and subtracted according to the following formula:

Trips mixed-use developments = Σ [Trips individual land uses] - internal trips

In the absence of local or site-specific data, the percentages given in NCHRP Report 323 and the ITE Trip Generation Handbook may be used as a guideline for determining the percentage of internal trips.

ANALYSIS

Several analyses are necessary to derive the study findings, recommendations and conclusions. The different analyses that might be required are:

- Capacity.
- Safety.
- Access Management.
- Traffic Control Needs.
- Signal Progression.
- On-site Circulation and Parking.
- Neighborhood Impacts.

For the horizon year, the analysis should be performed for the critical time period for conditions with and without the proposed development. The incremental impacts can be attributed to the subject site. The analysis should not be ended until one of three conclusions has been reached:

- 1. The proposed development can be accommodated in the horizon year transportation infrastructure with no additional improvements.
- 2. The proposed development can be accommodated in the horizon year transportation infrastructure consistent with Collier County policy and operating conditions subject to the recommended improvements/modifications.
- 3. The area will operate below the accepted level of service even without the development. No further significant deterioration will result if the proposed development is accommodated with the recommended changes.

CAPACITY ANALYSIS

Capacity analysis will be performed at all proposed site access points and all intersections -- both signalized and unsignalized in the study area. CCTDR Staff may also identify other critical and congested areas of the roadway network to be included in the analysis. Capacity analysis must be consistent with the methods described in the 2000 edition of the Highway Capacity Manual (HCM). The latest version of the Highway Capacity Software (rev 4.1c) should be used for capacity analysis. Other software such as CorSim, Synchro are acceptable.

Collier County has established two Transportation Concurrency Management Areas (TCMA) and a Transportation Concurrency Exception Area (TCEA) which are innovative tools provided to local governments in Rule 9J-5.0055(6), F.A.C. to use in the daunting task of serving the often competing demands for roadway facilities, orderly land use planning and development. For detailed information, please refer to Collier County Growth Management Plan, Transportation Element and LDC Section 3.15. See Appendix B1 for the TCMA and TCEA boundary maps.

SAFETY ANALYSIS

Safety analysis should include identification and recommendations about high accident locations, restricted sight distances, and pedestrian safety. The key elements are listed below:

- Accident Experience.
- Sight Distance.
- Pedestrians and Bicycles Accommodations.

ACCESS MANAGEMENT

• SITE ACCESS POINTS

To satisfactorily provide site access and maintain acceptable operational conditions on streets adjacent to the site, Collier County Access Control Policy and Standard Principles must be followed, (Resolution No. 01-247). In case of multiple driveways at a site, transportation-related needs for more than one driveway must be demonstrated. Both street peak and site peak should be taken into consideration while analyzing the site access points. All site access points should conform to Collier County Standards for Construction in Public Right-Of-Way, (Ordinance No. 93-64). Provisions must be made for vehicular storage so as not to backup out into the adjacent public street.

• TRAFFIC CONTROL NEEDS

Analysis should be carried out to determine whether traffic control warrants are met. Such warrants may be warrants for traffic signals, stop signs or yield signs. The warrant analysis must be performed according to the Manual of Uniform Traffic Control Devices (MUTCD).

MEDIAN OPENINGS

If a median opening is requested, a detailed analysis must be performed to determine if a median opening would negatively affect the operating condition of the roadway. Consideration should be given to the following:

- Warrants for a left turn signal at the opening.
- Approach speed of the opposing vehicles.
- Gaps in opposing traffic.
- Storage space at the median opening.
- Queuing and delay to the vehicles.
- Distance from the nearest intersection.
- Spacing between median openings (Access Management Policy).

ON-SITE REVIEW

On-site review may not be necessary for a Traffic Impact Study. Determination of the need for an on-site review shall be discussed at the initial meeting and shall be at a mutually agreed-upon time and place between the preparer and CCTDR staff.

INTERNAL CIRCULATION

Internal circulation should provide access to all areas in a manner easily understandable to motorists. Internal roadways must be marked and signed in accordance with the Manual of Uniform Traffic Control Devices (MUTCD).

NEIGHBORHOOD IMPACTS

Neighborhood transportation impacts are primarily caused by site-generated traffic using neighborhood streets as short cuts for ingress and egress. This can impair pedestrian safety, air quality, community cohesion and, consequently, property values. Most neighborhoods are sensitive to this issue and hence an analysis should be conducted to estimate the neighborhood impacts of the proposed development and mitigating measures suggested.

KEY POINTS CHECKLIST

The following key points should be addressed in the analysis before preparing the final conclusions and recommendations:

- 1. Show all calculations. Show how all numbers/factors were obtained. This may be handwritten and placed in a separate appendix.
- 2. Show demographic information and calculations.
- 3. Show how the development's driveway's enter/exit percentages were obtained.
- 4. Draft plans to scale. Show measurements between all driveways (both existing and proposed), streets, etc.
- 5. Show and label all driveways, streets from and adjacent to the development on scale plans. Show adjacent signalized intersections with measurements to the site.
- 6. Show the development's connections to existing signalized intersections, existing County and State roads and any local streets.
- 7. Note all references used, including page numbers, equations, table/figure numbers, etc. Note reference information in the report at the point it is used.
- 8. Provide applicable pages/sentences from references used.
- 9. Use Highway Capacity Manual/Software (current edition/version) for capacity studies.
- 10. From the development and along existing County Arterial Roadways, assess the impact of the new traffic on operation of through streets. A computer-modeling program such as HCS or Synchro, which is pre-approved by CCTDR, must be used for Intersection Analysis. This should include entire adjacent signal systems, both with and without any proposed signal at the development.

- 11. Perform a gap analysis on a driveway where a signal is requested. Take into account adjacent signals. Gap analysis of other proposed drives onsite might be requested if deemed appropriate by CCTDR staff.
- 12. Compute trip generation for signal warrants using initial development. (Do not include future expansions.)
- 13. Compute trip generation for geometric changes (turn lane lengths, etc.) using ultimate build-out figures. Give dates for planned expansions. Show percent growth in volume used.
- 14. For the signal warrant analysis, justify the percentage of right-turns-on-red used.
- 15. Provide preliminary signal timings for the proposed provisional traffic signal. If the proposed signal would be included in an existing traffic signal system, then the revised timings for the complete system shall be provided.
- 16. If there are any major traffic generators nearby, collect data to demonstrate how they will affect the development.
- 17. Show exact locations where counts were obtained. Explain how and when counts were taken.
- 18. Provide justifications for all driveway accesses requested.
- 19. Provide copies of all raw data.
- 20. Label all forms completely. Assure that copies are clear and legible.

CONCLUSIONS AND RECOMMENDATIONS

If the Traffic Impact Study reveals that the projected traffic volumes on the horizon year roadway network will operate in a safe and efficient manner at an acceptable level of service, then no project-related improvements are required. However, if deficiencies are indicated, mitigating measures will be required. These measures may include, but are not necessarily limited to:

- 1. Installation of traffic signals.
- 2. Installation of traffic control signs.
- 3. Addition of lanes.
- 4. Addition of deceleration lanes.
- 5. Restriction of turning movements.
- 6. Adjustment of cycle lengths.
- 7. Introduction of additional signal phases.

However, if reasonable mitigating measures cannot be implemented to assure that traffic will operate in an efficient way, a more detailed evaluation of project size, land use types, and development phasing may be required. If viable transportation improvements cannot be recommended, then steps must be taken to reduce the trip generation rate of the proposed development. Some possible approaches that may be adopted are:

- Increased transit usage.
- Car-pool/van-pool programs.
- Congestion pricing.
- Reduced parking or increased parking fees.
- Staggered work schedules.

Any Transportation Demand Management recommendations should take into account:

- 1. The timing of the short-range and long-range transportation system improvements that are already scheduled or anticipated.
- 2. Anticipated timing of adjacent developments.
- 3. Phasing of the subject development.
- 4. Right-of-way needs and availability.
- 5. County priorities for transportation improvement funding.
- 6. Cost-effectiveness of the proposed improvements.

Note: For the TCMA and TCEA, please refer to the Collier County Growth Management Plan and LDC Section 3.15 along with Transportation Concurrency Management Staff.

RECOMMENDED PLAN OF ACTION

Implementation of recommendations should be presented as a "plan of action." This action plan should recommend improvements; state why they are needed and when they are to be implemented.

THE REPORT

The Traffic Impact Study report should document the purpose, procedures, data sources, assumptions, findings, conclusions and recommendations of the study. It should be concise and complete. The report should be organized in a logical sequence and methodically take the reader through the entire process of the Traffic Impact Study. It should be kept in mind that the report might be of interest to the elected officials and other non-technical people. Hence, clarity should be paramount. The report format presented below provides a uniform framework that will facilitate both the preparation and the review of the report. Any major departures from this standard format must be agreed upon at the initial meeting and mentioned in the subsequent Memorandum of Understanding (see Chapter 5).

REPORT FORMAT

Report Cover and Title Page

Table of Contents

List all the major sections; tables and figures may be identified by letter or by number, according to the study preparer's preference.

List of Exhibits

Some of the typical exhibits that could be included in a Traffic Impact Study are tabulated in Table 16.1. Because the exhibits actually needed will vary from study to study, list all the tables and figures included in the report by page number. Tables and figures may be identified by letter (as in Table 16.1) or by number, according to the study preparer's preference.

Executive Summary

Each Traffic Impact Study report should begin with an Executive Summary. It should be limited to a one-page or two-page document to facilitate examination by the CCTDR Staff. It should contain the salient features of the study and should summarize the study purpose, and its conclusions and recommendations. Reports of 10 pages or less do not require an Executive Summary.

Prototype Report Outline

A prototype report outline is given in Appendix A-2. It is intended to be a list of items for the preparer and reviewer to consider at the initial meeting. Many items may not apply to any particular proposed development, and need not be included in the report. It is also possible that items not listed in Appendix A-2 may be applicable to a particular site, as decided upon in the initial meeting.

Report Certification

Traffic Impact Studies shall be certified by the preparer (see Chapter 2). Such certification shall state that the study has been conducted according to the methods described in this Guide. A report for any of the limited studies or traffic operational analyses should provide information in the first paragraph that the reviewer directed or agreed that only a limited study be conducted.

PUBLIC RECORD

Traffic Impact Study reports become public record upon submittal. Information provided in the study may be used for subsequent studies.

Table 16.1 Typical Exhibits in a Detailed Traffic Impact Study

| ITEM | TITLE | DESCRIPTION |
|-------------|----------------------------|--|
| Figure A | Site Location | Area map showing site location and area of influence. |
| Figure B | Existing | Existing roadway system serving site. Should show |
| | Transportation | system and all major & minor routes adjacent to the site. |
| Figure C | Existing and Pending | Map showing existing and pending land uses and |
| | Land Use | developments in the study area. |
| Figure D | Current Traffic | Most recent traffic volumes on roads in the study area. |
| _ | Volumes | |
| Figure E | Existing Peak Hour | Current peak hour turning volumes at each location |
| | Turning Volumes | critical to the study. |
| Figure F | Anticipated | Area transportation system map showing programmed |
| | Transportation | and applicable roadways; improvements, including |
| | | transit, bikeways and pedestrian ways; improvements |
| | | affecting site access or traffic flow through the study |
| | | area. |
| Table A or | Directional | Map or table showing the proportion of site traffic |
| Figure G | Distribution | approaching and departing the area on each roadway. |
| Table B | Estimated Site | Analysis period site traffic generation by direction. |
| | Traffic Generation | |
| Figure H | Site Traffic | Map of horizon year roadway network showing peak |
| m 11 G | Tr. C | hour turning volumes of site-generated traffic. |
| Table C | Trip Generation of | Trips generated by off-site developments within the study |
| | Non-Site | area. |
| Fi I | Development Site | Mary alternative week house to suit a real toward day to the |
| Figure I | Estimated Non-Site Traffic | Map showing peak hour turning volumes due to the |
| Eigura I | Estimated Total | developments in the study area and through traffic. |
| Figure J | Horizon Year Traffic | Peak hour turning movements in horizon year. (Sum of Figures H and I). |
| Figure K or | Level of Service | Level of service at critical locations under conditions and |
| Table D | (LOS) | in horizon year with & without the proposed |
| Table D | (LOS) | development. |
| Figure L or | Recommended | Table or figure showing improvements by location and |
| Table E | Improvements | type. If phasing of improvements is to be stipulated, they |
| I doic L | Improvements | have to be shown. |
| | | nave to be shown. |

STAFF REVIEW

The purpose of staff review is to ensure that the Traffic Impact Study has been properly prepared and that the recommendations made by the preparer are realistic and implemental. Staff reviews are not intended to deter new developments. They are to assure that traffic-related problems are anticipated and that effective mitigation measures are identified. Contact between the preparer and the reviewer during the preparation of the TIS is encouraged.

FORMAL REVIEW

This review is conducted after the preparer has submitted the report. The formal review process will produce a list of the following findings:

- Acceptable analyses and conclusions.
- Unacceptable analyses and conclusions.
- Acceptability of recommended site access provisions and roadway improvements.
- List of required improvements that might be considered to mitigate impacts of the proposed development.

Following the review, the reviewer(s) will send to the preparer a list of requested study revisions or a letter accepting the study.

REQUEST FOR REVISION

Any requests for study revisions will indicate the findings of the formal review and clearly specify the additional information required. This additional report should be in the form of an addendum to the original study. In certain cases, a revised report may be requested.

APPENDIX A

INITIAL MEETING CHECKLIST

Suggestion: Use this Appendix as a worksheet to ensure that no important elements are overlooked. Cross out the items that do not apply.

APPENDIX A-2

SAMPLE REPORT OUTLINE

Suggestion: Use this Appendix as a worksheet to ensure that no important elements are overlooked. Cross out items that do not apply.

Report Outline

- A. Development name and location
- B. Application number
- C. Applicant name
- D. Preparer name and organization
- E. Report date

Title Sheet

- A. Development name and location
- B. Application number
- C. Applicant's name, address and telephone number
- D. Preparer's name, title, organization, address and telephone number
- E. Date of original report
- F. Report revision date

Table of Contents

List of Figures and Tables

I. Introduction and Summary

- A. Purpose of report and study objectives
- B. Executive summary
 - 1. Site location and study area
 - 2. Development description
 - 3. Principal findings
 - 4. Conclusions and recommendations

II. Proposed Development

- A. Subject site
 - 1. Land use and intensity
 - 2. Location
 - 3. Site plan
 - 4. Zoning
 - 5. Phasing and timing
- B. Off-site developments

III. Area Conditions

- A. Study area limits
- B. Study area land use
 - 1. Existing land use
 - 2. Existing zoning
 - 3. Anticipated future developments
- C. Site accessibility
 - 1. Area roadway system
 - a. Existing
 - b. Proposed
 - 2. Traffic volumes
 - 3. Transit service
 - 4. Transportation system management programs

IV. Projected Traffic

- A. Site traffic (each horizon year)
 - 1. Trip generation
 - 2. Trip distribution
 - 3. Traffic assignment
- B. Non-site traffic (each horizon year)
 - 1. Method of projection
 - 2. Trip generation
 - 3. Trip distribution
 - 4. Traffic assignment
- C. Total traffic (each horizon year)

V. Analysis

- A. Site access
- B. Capacity and level of service
- C. Traffic safety
- D. Traffic control
- E. Site circulation and parking

VI. Improvement Analysis

- A. Improvements to accommodate non-site traffic
 - 1. Physical
 - 2. Operational
- B. Additional improvements to accommodate site traffic
 - 1. Physical
 - 2. Operational
 - 3. Travel demand reduction
- C. Alternative improvements
- D. Status of improvements already funded, programmed, or planned
- E. Evaluation

VII. Findings

- A. Site accessibility
- B. Traffic impacts
- C. Additional improvement
- D. Compliance with traffic-related local codes

VIII. Recommendations

- A. Site access/circulation plan
- B. Roadway improvements
 - 1. On-site
 - 2. Off-site
- C. Transportation system management actions
- D. Other

IX. Conclusion

- A. Traffic impact of proposed development
- B. Adequacy of proposed plan including recommended improvements
